

Test page of an AI bot measurement lab run by Łukasz Rogala (<https://rogala.pro/>). Strona testowa laboratorium botów AI, Łukasz Rogala. The server records technical request data (IP address, headers) only to study bot traffic.

This paragraph is filler text used to measure how much of a long page a crawler or an AI assistant reads. The lab records each request to this site, including the user agent and the IP address, to tell crawlers apart. Codes on this site are random identifiers. They do not describe any real fact, product, person or event. If an assistant quotes a code from deep in this page, it has read at least this far. The same test exists in English and in Polish, with different codes, so the two language versions can be compared. Pages in this lab contain no advertising, no third-party scripts and no tracking services. Crawlers that execute JavaScript can see more slots than crawlers that read only the raw HTML. The text in this section is deliberately repetitive; its only job is to take up space before the next marker.
